Four-fold benefits for customers: new *KaControl* building management system

Lingen (Ems), 11.02.2011 – The *KaControl* automation system combines new benefits for end-users and operators, specialist trades and designers. Kampmann GmbH is showcasing its extended functions at the ISH for the first time: Hall 8, stand C30 and Hall 11, stand B30.

KaControl is unbelievably easy to operate: The end user simply operates a modestly designed, flat control unit. It is only approx. 9 x 9 cm in size with one-touch operation. There is also a version with two additional keys for ease of access on request.

The result: low-energy operation

Simple to operate but backed up by massive performance: the Kampmann applications can now guarantee optimum cooperation between units with interfaces to leading BMS standards, such as BACnet, LON or ModBus. It also copes with recently introduced innovations in heating, cooling and ventilation with complete ease. It is totally irrelevant whether ***KaControl*** is integrated into a new or an existing building management strategy. On balance, all users will notice more economical operation and cost-savings in all cases.

System solutions for every task

A further benefit for project designers is that the *KaControl* can be used in the most diverse applications, including centralised and decentralised air conditioning in commercial, industrial and private buildings. Unit solutions for all tasks can be individually combined and incorporated into a single overall operating system with ***KaControl***.
